

## Differential Clock Buffer/Driver

### Features

- Phase-locked loop (PLL) clock distribution for double data rate synchronous DRAM applications
- Distributes one clock input to six differential outputs
- External feedback pin FBIN is used to synchronize output to clock input
- Conforms to DDRI specification
- Spread Aware™ for electromagnetic interference (EMI) reduction
- 28-pin SSOP package

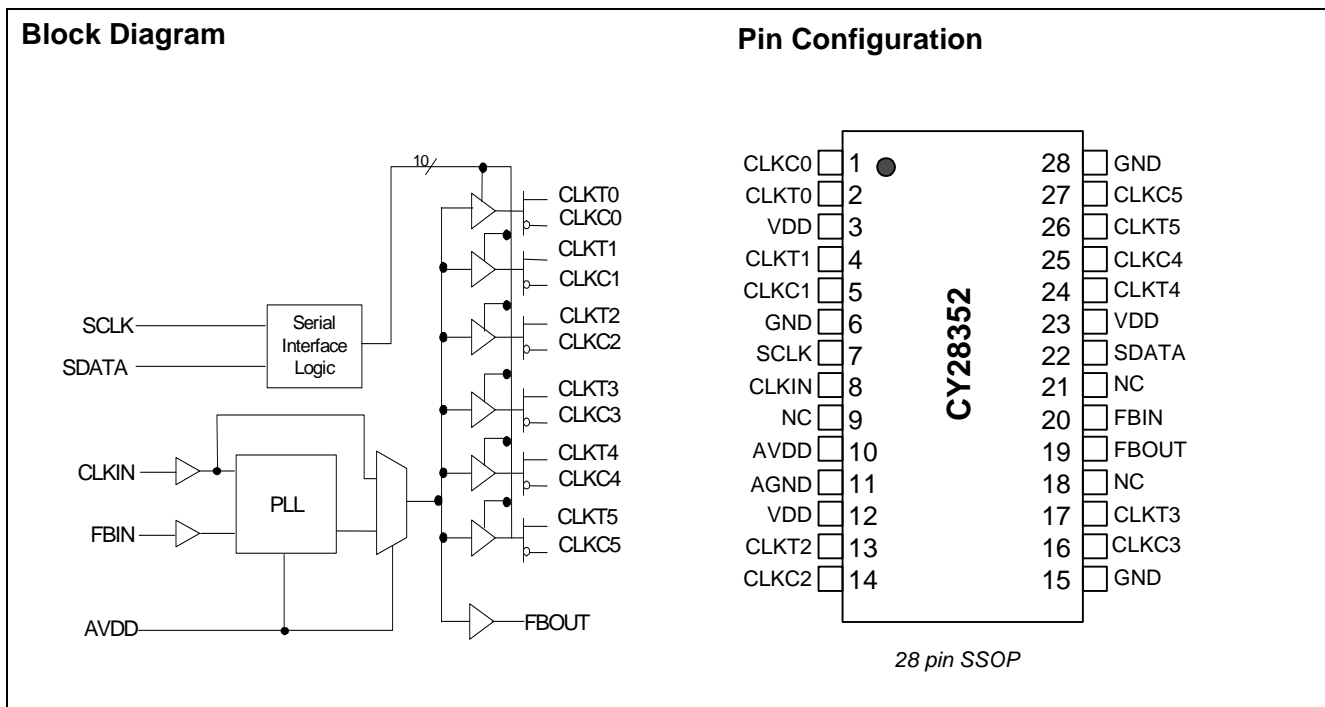

### Description

This PLL clock buffer is designed for 2.5- $V_{DD}$  and 2.5- $AV_{DD}$  operation and differential output levels.

This device is a zero delay buffer that distributes a clock input CLKIN to six differential pairs of clock outputs (CLKT[0:5], CLKC[0:5]) and one feedback clock output FBOUT. The clock outputs are controlled by the input clock CLKIN and the feedback clock FBIN.

The two-line serial bus can set each output clock pair (CLKT[0:5], CLKC[0:5]) to the Hi-Z state. When  $AV_{DD}$  is grounded, the PLL is turned off and bypassed for test purposes.

The PLL in this device uses the input clock CLKIN and the feedback clock FBIN to provide high-performance, low-skew, low-jitter output differential clocks.

**Pin Description<sup>[1]</sup>**

Pin Number	Pin Name	I/O	Pin Description	Electrical Characteristics
8	CLKIN	I	<b>Complementary Clock Input.</b>	Input
20	FBIN	I	<b>Feedback Clock Input.</b> Connect to FBOUT for accessing the PLL.	Input
2,4,13,17,24,26	CLKT(0:5)	O	<b>Clock Outputs</b>	Differential Outputs
1,5,14,16,25,27	CLKC(0:5)	O	<b>Clock Outputs</b>	
19	FBOUT	O	<b>Feedback Clock Output.</b> Connect to FBIN for normal operation. A bypass delay capacitor at this output will control Input Reference/Output Clocks phase relationships.	Output
7	SCLK	I	<b>Serial Clock Input.</b> Clocks data at SDATA into the internal register.	Data Input for the two line serial bus
22	SDATA	I/O	<b>Serial Data Input.</b> Input data is clocked to the internal register to enable/disable individual outputs. This provides flexibility in power management.	Data Input and Output for the two line serial bus
3,12,23	VDD		<b>2.5V Power Supply for Logic</b>	2.5V Nominal
10	AVDD		<b>2.5V Power Supply for PLL</b>	2.5V Nominal
6,15,28	GND		<b>Ground</b>	
11	AGND		<b>Analog Ground for PLL</b>	
9, 18, 21	NC		<b>Not Connected</b>	

**Note:**

1. A bypass capacitor (0.1 $\mu$ F) should be placed as close as possible to each positive power pin (< 0.2"). If these bypass capacitors are not close to the pins, their high-frequency filtering characteristic will be cancelled by the lead inductance of the traces.

**Maximum Ratings<sup>[2]</sup>**

Input Voltage Relative to  $V_{SS}$ : .....  $V_{SS} - 0.3V$   
 Input Voltage Relative to  $V_{DDQ}$  or  $AV_{DD}$ : .....  $V_{DD} + 0.3V$   
 Storage Temperature: .....  $-65^{\circ}C$  to  $+150^{\circ}C$   
 Operating Temperature: .....  $0^{\circ}C$  to  $+70^{\circ}C$   
 Maximum Power Supply: .....  $3.5V$

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation,  $V_{IN}$  and  $V_{OUT}$  should be constrained to the range:

$$V_{SS} < (V_{IN} \text{ or } V_{OUT}) < V_{DD}$$

Unused inputs must always be tied to an appropriate logic voltage level (either  $V_{SS}$  or  $V_{DD}$ ).

**DC Parameters**  $V_{DDA} = V_{DDQ} = 2.5V \pm 5\%$ ,  $T_A = 0^{\circ}C$  to  $+70^{\circ}C$ <sup>[3]</sup>

**Notes:**

- Multiple Supplies:** The voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is NOT required.
- Unused inputs must be held HIGH or LOW to prevent them from floating.
- For load conditions, see *Figure 7*.
- The value of  $V_{OC}$  is expected to be  $|V_{TR} + V_{CP}|/2$ . In case of each clock directly terminated by a  $120\Omega$  resistor. See *Figure 7*.
- All outputs switching loaded with  $16\text{ pF}$  in  $60\Omega$  environment. See *Figure 7*

**Zero Delay Buffer**

When used as a zero delay buffer the CY28352 will likely be in a nested clock tree application. For these applications the CY28352 offers a clock input as a PLL reference. The CY28352 can then lock onto the reference and translate with near zero delay to low-skew outputs. For normal operation, the external feedback input, FBIN, is connected to the feedback output, FBOUT. By connecting the feedback output to the feedback input the propagation delay through the device is eliminated. The PLL works to align the output edge with the input reference edge thus producing a near zero delay. The reference frequency affects the static phase offset of the PLL and thus the relative delay between the inputs and outputs.

When  $V_{DDA}$  is strapped LOW, the PLL is turned off and bypassed for test purposes.

**Power Management**

The individual output enable/disable control of the CY28352 allows the user to implement unique power management schemes into the design. Outputs are three-stated when disabled through the two-line interface as individual bits are set low in Byte0 and Byte1 registers. The feedback output FBOUT cannot be disabled via two line serial bus. The enabling and disabling of individual outputs is done in such a manner as to eliminate the possibility of partial "runt" clocks.

**Function Table**

Inputs		Outputs			PLL
VDDA	CLKIN	CLKT(0:5) <sup>[12]</sup>	CLKC(0:5) <sup>[12]</sup>	FBOUT	
GND	L	L	H	L	BYPASSED/OFF
GND	H	H	L	H	BYPASSED/OFF
2.5V	L	L	H	L	On
2.5V	H	H	L	H	On
2.5V	<20MHz	Hi-Z	Hi-Z	Hi-Z	Off

**Notes:**

7. Parameters are guaranteed by design and characterization. Not 100% tested in production.
8. PLL is capable of meeting the specified parameters while supporting SSC synthesizers with modulation frequency between 30 kHz and 33.3 kHz, with a down spread of -0.5%.
9. Refers to transition of non-inverting output.
10. All differential input and output terminals are terminated with 120Ω/16 pF as shown in *Figure 7*.
11. Period Jitter and Half-Period Jitter specifications are separate, and must be met independently of each other.
12. Each output pair can be three-stated via the two-line serial interface.

## Serial Control Registers

Following the acknowledge of the Address Byte, two additional bytes must be sent:

- Command Code byte
- Byte Count byte.
