#### Functional Description

The FCT157T and FCT158T are quad two-input multiplexers that select four bits of data from two sources under the control of a common data Select input (S). The Enable input (E) is Active LOW. When (E) is HIGH, all of the outputs (Y) are forced LOW regardless of all other input conditions.

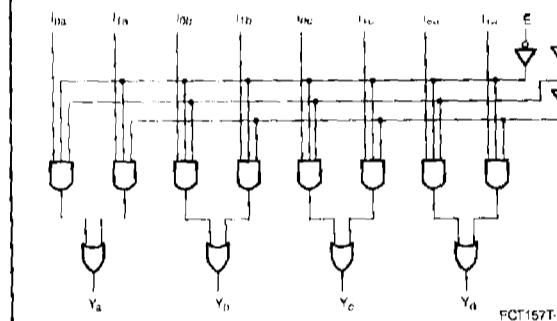

Moving data from two groups of registers to four common output buses is a common use of the FCT157T and FCT158T. The state of the Select input

determines the particular register from which the data comes. It can also be used as a function generator. The device is useful for implementing highly irregular logic by generating any four of the sixteen different functions of two variables with one variable common.

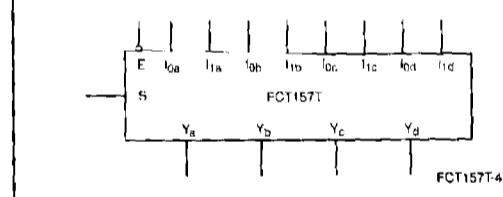

These devices are logic implementation of a four-pole, two-position switch where the position of the switch is determined by the logic levels supplied to the Select input. The outputs of the FCT157T are non-inverting whereas the FCT158T has inverting outputs.

The outputs are designed with a power-off disable feature to allow for live insertion of boards.

#### Notes:

2. Unless otherwise noted, these limits are over the operating free-air temperature range.
3. Unused inputs must always be connected to an appropriate logic voltage level, preferably either V<sub>CC</sub> or ground.
4. T<sub>A</sub> is the "instant-on" case temperature.
5. Typical values are at V<sub>CC</sub>=5.0V, T<sub>A</sub>=+25°C ambient.
6. This parameter is guaranteed but not tested.
7. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parametric tests. In any sequence of parameter tests, I<sub>OS</sub> tests should be performed last.
