# Description

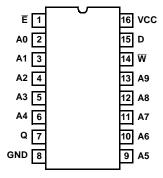

The HM-6508/883 is a 1024 x 1 static CMOS RAM fabricated using self-aligned silicon gate technology. Synchronous circuit design techniques are employed to achieve high performance and low power operation.

On chip latches are provided for address allowing efficient interfacing with microprocessor systems. The data output buffers can be forced to a high impedance state for use in expanded memory arrays.

The HM-6508/883 is a fully static RAM and may be maintained in any state for an indefinite period of time. Data retention supply voltage and supply current are guaranteed over temperature.

# **Absolute Maximum Ratings**

## 

#### **Thermal Information**

Thermal Resistance (Typical, Note 1)	$\theta_{\sf JA}$	$\theta$ JC
CERDIP Package	75°C/W	15 <sup>0</sup> C/W
Maximum Storage Temperature Range	65	<sup>o</sup> C to +150 <sup>o</sup> C
Maximum Junction Temperature		+175 <sup>0</sup> C
Maximum Lead Temperature (Soldering 1	0s)	+300°C

# **Operating Conditions**

Operating Voltage Range	
Operating Temperature Range	55 <sup>0</sup> C to +125 <sup>0</sup> C
Input Low Voltage	
Input High Voltage	VCC -2.0V to VCC
Input Rise and Fall Time	40ns Max.

# 14 5V to 15 5V Die Characteristics

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

1.  $\theta_{JA}$  is measured with the component mounted on an evaluation PC board in free air.

<sup>1.</sup> The parameters listed in Table 3 are controlled via design or process; parameters are characterized upon initial design and after major process and/or design changes.

TR			

	INPUTS				OUTPUTS	
TIME REFERENCE	Ē	w	Α	D	Q	FUNCTION
-1	Н	X	Х	Х	Z	Memory Disabled
0		Н	V	Х	Z	Cycle Begins, Addresses are Latched
1	L	Н	Х	Х	Х	Output Enabled
2	L	Н	Х	Х	V	Output Valid
3	<u>_</u>	Н	Х	Х	V	Read Accomplished
4	Н	X	Х	Х	Z	Prepare for Next Cycle (Same as -1)
5		Н	V	Х	Z	Cycle Ends, Next Cycle Begins (Same as 0)

In the HM-6508/883 Read Cycle, the address information is latched into the on-chip registers on the falling edge of E (T=0). Minimum address setup and hold time requirements must be met. After the required hold time, the addresses may change state without affecting device operation. During time (T=1) the data output becomes enabled; however, the

data is not valid until during time (T = 2).

 $\overline{W}$  must remain high for the read cycle. After the output data has been read,  $\overline{E}$  may return high (T = 3). This will disable the chip and force the output buffer to a high impedance state. After the required  $\overline{E}$  high time (TEHEL) the RAM is

# Timing Wavforms (continued)

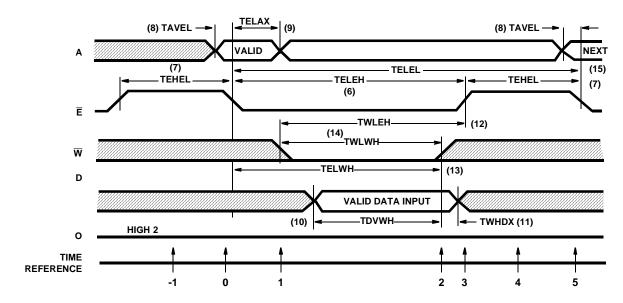

FIGURE 2. WRITE CYCLE

#### **TRUTH TABLE**

TIME	INPUTS				OUTPUTS	
REFERENCE	Ē	w	Α	D	Q	FUNCTION
-1	Н	Х	X	X	Z	Memory Disabled
0		Х	V	Х	Z	Cycle Begins, Addresses are Latched
1	L	<u>_</u>	Х	Х	Z	Write Period Begins
2	L	<u>_</u>	Х	V	Z	Data is Written
3		Н	Х	Х	Z	Write Completed
4	Н	Х	Х	Х	Z	Prepare for Next Cycle (Same as -1)
5		Х	V	Х	Z	Cycle Ends, Next Cycle Begins (Same as 0)

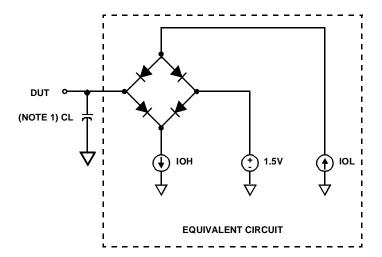

The write cycle is initiated by the falling edge of  $\overline{E}$  which latches the address information into the on chip registers. The write portion of the cycle is defined as both  $\overline{E}$  and  $\overline{W}$  being low simultaneously.  $\overline{W}$  may go low anytime during the cycle, provided that the write enable pulse setup time (TWLEH) is met. The write portion of the cycle is terminated by the first rising edge of either  $\overline{E}$  or  $\overline{W}$ . Data setup and hold times must be referenced to the terminating signal.

If a series of consecutive write cycles are to be performed, the  $\overline{W}$  line may remain low until all desired locations have been written. When this method is used, data setup and hold

times must be referenced to the rising edge of  $\overline{E}$ . By positioning the  $\overline{W}$  pulse at different times within the  $\overline{E}$  low time (TELEH), various types of write cycles may be performed.

If the  $\overline{E}$  low time (TELEH) is greater than the  $\overline{W}$  pulse (TWLWH), plus an output enable time (TELQX), a combination read write cycle is executed. Data may be modified an indefinite number of times during any write cycle (TELEH). The data input and data output pins may be tied together for use with a common I/O data bus structure. When using the RAM in this method, allow a minimum of one output disable time (TWLQZ) after  $\overline{W}$  goes low before applying input data to the bus. This will ensure that the output buffers are not active.
