±15kV ESD Protected, 10nA Supply-Current, +3V to +5.5V, 250k/1Mbps, RS-232 Transmitters/Receivers

The Intersil ICL3237E contains 3.0V to 5.5V powered RS-232 transmitters/receivers which meet EIA/TIA-232 and V.28/V.24 specifications, even at V_{CC} = 3.0V. Additionally, it provides ±15kV ESD protection (IEC61000-4-2 Air Gap and Human Body Model) on transmitter outputs and receiver inputs (RS-232 pins). Targeted applications are cell phones, PDAs, Palmtops, and notebook and laptop computers where the low operational, and even lower standby, power consumption is critical. Efficient on-chip charge pumps, coupled with the manual powerdown function, reduce the standby supply current to a 10nA trickle. Small footprint packaging, and the use of small, low value capacitors ensure board space savings as well. Data rates greater than 1Mbps (MBAUD = V_{CC}) are guaranteed at worst case load conditions. The ICL3237E is fully compatible with 3.3V only systems, mixed 3.3V and 5.0V systems, and 5.0V only systems.

The ICL3237E is a 5 driver, 3 receiver device that also includes a noninverting always-active receiver for "wake-up" capability.

Table 1 summarizes the features of the device represented by this data sheet, while Application Note AN9863 summarizes the features of each device comprising the ICL32XX 3V family.

Features

- ESD Protection For RS-232 I/O Pins to ±15kV (IEC61000)
- Pin Compatible Replacement for MAX3237E
- Pin Selectable, Guaranteed Data Rate . . 250kbps/1Mbps
- Meets EIA/TIA-232 and V.28/V.24 Specifications at 3V
- RS-232 Compatible with V_{CC} = 2.7V
- Latch-Up Free
- On-Chip Voltage Converters Require Only Four External Capacitors
- Manual Powerdown Feature
- Flow Through Pinout
- Rx and Tx Hysteresis For Improved Noise Immunity
- Rx Active in Powerdown; Separate Rx Enable Pin
- Guaranteed Minimum Slew Rate . . . . 6V/μs or 24V/μs
- Wide Power Supply Range . . . . Single +3V to +5.5V
- Low Supply Current in Powerdown State. 10nA

Applications

- Any System Requiring RS-232 Communication Ports
  - Battery Powered, Hand-Held, and Portable Equipment
  - Laptop Computers, Notebooks, Palmtops
  - Modems, Printers and other Peripherals
  - Data Cradles and Cables
  - Cellular/Mobile Phone

Pin Descriptions

PIN	FUNCTION
V_{CC}	System power supply input (3.0V to 5.5V).
V+	Internally generated positive transmitter supply (+5.5V).
V-	Internally generated negative transmitter supply (-5.5V).
GND	Ground connection.
C1+	External capacitor (voltage doubler) is connected to this lead.
C1-	External capacitor (voltage doubler) is connected to this lead.
C2+	External capacitor (voltage inverter) is connected to this lead.
C2-	External capacitor (voltage inverter) is connected to this lead.
T_{IN}	TTL/CMOS compatible transmitter Inputs (Note 2).
T_{OUT}	± 15kV ESD Protected, RS-232 level (nominally ± 5.5V) transmitter outputs.
R_{IN}	± 15kV ESD Protected, RS-232 compatible receiver inputs.
R_{OUT}	TTL/CMOS level receiver outputs.
R_{OUTB}	TTL/CMOS level, noninverting, always enabled receiver output.
$\overline{EN}$	Active low receiver enable control; doesn't disable R_{OUTB} output (Note 2).
$\overline{SHDN}$	Active low input to shut down transmitters and on-board power supply, to place device in low power mode (Note 2).
MBAUD	Input low selects 250kbps data rate, and input high selects 1Mbps data rate (Note 2).

NOTE:

2. These input pins incorporate positive feedback resistors. Once the input is driven to a valid logic level, the feedback resistor maintains that logic level until V_{CC} is removed.

Typical Operating Circuit
ICL3237E

NOTES:

3. THE NEGATIVE TERMINAL OF C_3 CAN BE CONNECTED TO EITHER V_{CC} OR GND.

4. FOR V_{CC} = 3.15V (3.3V -5%), USE C_1 - C_4 = 0.1μF OR GREATER. FOR V_{CC} = 3.0V (3.3V -10%), USE C_1 - C_4 = 0.22μF.

6. Skew is measured at the input switching points (1.4V).

7. These inputs utilize a positive feedback resistor. The input current is negligible when the input is at either supply rail.

intersil

Detailed Description

The ICL3237E operates from a single +3V to +5.5V supply, guarantees a 1Mbps minimum data rate (MBAUD = V_{CC}), requires only four small external $0.1\mu F$ ($0.22\mu F$ for $V_{CC} = 3.0V$) capacitors, features low power consumption, and meets all EIA/TIA-232 and V.28 specifications. The circuit is divided into three sections: The charge pump, the transmitters, and the receivers.

Charge-Pump

Intersil's new ICL32XX family utilizes regulated on-chip dual charge pumps as voltage doublers, and voltage inverters to generate $\pm5.5V$ transmitter supplies from a V_{CC} supply as low as 3.0V. This allows these devices to maintain RS-232 compliant output levels over the $\pm10\%$ tolerance range of 3.3V powered systems. The efficient on-chip power supplies require only four small, external $0.1\mu F$ capacitors for the voltage doubler and inverter functions at $V_{CC} = 3.3V$. See the "Capacitor Selection" section, and Table 3 for capacitor recommendations for other operating conditions. The charge pumps operate discontinuously (i.e., they turn off as soon as the V+ and V- supplies are pumped up to the nominal values), resulting in significant power savings.

Transmitters

The transmitters are proprietary, low dropout, inverting drivers that translate TTL/CMOS inputs to EIA/TIA-232 output levels. Coupled with the on-chip $\pm5.5V$ supplies, these transmitters deliver true RS-232 levels over a wide range of single supply system voltages.

All transmitter outputs disable and assume a high impedance state when the device enters the powerdown mode (see Table 2). These outputs may be driven to $\pm12V$ when disabled.

The ICL3237E guarantees a 1Mbps data rate (MBAUD = V_{CC}) for full load conditions ($3k\Omega$ and 250pF), $V_{CC} \geq 3.0V$, with one transmitter operating at full speed. Under more typical conditions of $V_{CC} \geq 3.3V$, $C_{1-4} = 0.1\mu F$, $R_L = 3k\Omega$, and $C_L = 250pF$, one transmitter easily operates at 1.7Mbps.

Transmitter inputs incorporate an active positive feedback resistor that maintains the last driven input state in the absence of a forcing signal. Unused transmitter inputs may be left unconnected.

Receivers

The ICL3237E contains standard inverting receivers that tristate only when the $\overline{EN}$ control line is driven high. Additionally, it includes a noninverting (monitor) receiver (denoted by the R_{OUTB} label) that is always active, regardless of the state of any control lines. All the receivers convert RS-232 signals to CMOS output levels and accept inputs up to $\pm25V$ while presenting the required $3k\Omega$ to $7k\Omega$ input impedance (see Figure 1) even if the power is off ($V_{CC} = 0V$). The receivers' Schmitt trigger input stage uses hysteresis to increase noise immunity and decrease errors due to slow input signal transitions.

Monitor receivers remain active even during manual powerdown and forced receiver disable, making them extremely useful for Ring Indicator monitoring. Standard receivers driving powered down peripherals must be disabled to prevent current flow through the peripheral's protection diodes (see Figures 2 and 3). This renders them useless for wake up functions, but the corresponding monitor receiver can be dedicated to this task as shown in Figure 3.

FIGURE 1. INVERTING RECEIVER CONNECTIONS

Powerdown Functionality

This 3V device requires a nominal supply current of 0.3mA during normal operation (not in powerdown mode). This is considerably less than the 5mA to 11mA current required of 5V RS-232 devices. The already low current requirement drops significantly when the device enters powerdown mode. In powerdown, supply current drops to 10nA, because the on-chip charge pump turns off (V+ collapses to V_{CC}, V- collapses to GND), and the transmitter outputs tristate. This micro-power mode makes the ICL3237E ideal for battery powered and portable applications.

Software Controlled (Manual) Powerdown

On the ICL3237E, the powerdown control is via a simple shutdown ($\overline{SHDN}$) pin. Driving this pin high enables normal operation, while driving it low forces the IC into it's powerdown state. Connect $\overline{SHDN}$ to V_{CC} if the powerdown function isn't needed. Note that all the receiver outputs remain enabled during shutdown (see Table 2). For the lowest power consumption during powerdown, the receivers should also be disabled by driving the $\overline{EN}$ input high (see next section, and Figures 2 and 3). The time required to exit powerdown, and resume transmission is only $100\mu s$.

TABLE 2. POWERDOWN AND ENABLE LOGIC TRUTH TABLE

SHDN INPUT	EN INPUT	TRANSMITTER OUTPUTS	RECEIVER OUTPUTS	R$_{OUTB}$ OUTPUT	MODE OF OPERATION
L	L	High-Z	Active	Active	Manual Powerdown
L	H	High-Z	High-Z	Active	Manual Powerdown w/Rcvr. Disabled
H	L	Active	Active	Active	Normal Operation
H	H	Active	High-Z	Active	Normal Operation w/Rcvr. Disabled
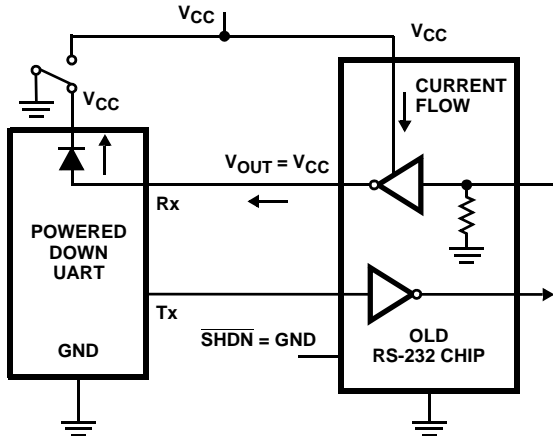

FIGURE 2. POWER DRAIN THROUGH POWERED DOWN PERIPHERAL
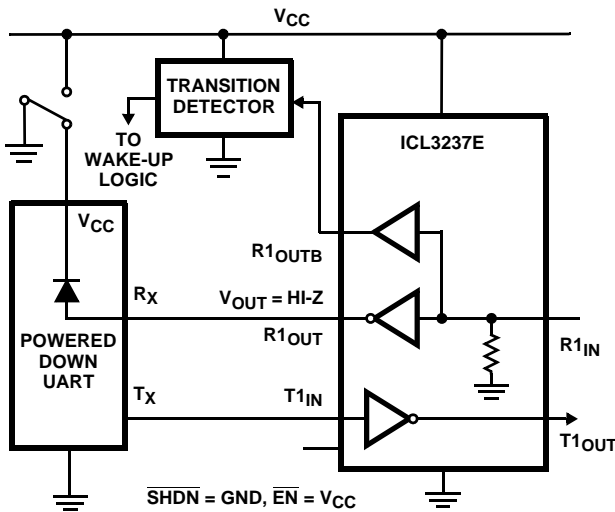

FIGURE 3. DISABLED RECEIVERS PREVENT POWER DRAIN

Receiver ENABLE Control

This device also features an $\overline{EN}$ input to control the receiver outputs. Driving $\overline{EN}$ high disables all the inverting (standard) receiver outputs placing them in a high impedance state. This is useful to eliminate supply current, due to a receiver output forward biasing the protection diode, when driving the input of a powered down (V_{CC} = GND) peripheral (see Figure 2). The enable input has no effect on transmitter nor monitor (R$_{OUTB}$) outputs.

MegaBaud Selection

In normal operating mode (MBAUD = GND), the ICL3237E transmitters guarantee a 250kbps data rate with worst-case loads of 3kΩ in parallel with 1000pF. This provides compatibility with PC-to-PC communication software, such as Laplink™.

For higher speed serial communications, the ICL3237E features MegaBaud operation. In MegaBaud operating mode (MBAUD = V_{CC}), the ICL3237E transmitters guarantee a 1Mbps data rate with worst-case loads of 3kΩ in parallel with 250pF for 3.0V < V_{CC} < 4.5V. For 5V ±10% operation, the ICL3237E transmitters guarantee a 1Mbps data rate with worst-case loads of 3kΩ in parallel with 1000pF.

Capacitor Selection

The charge pumps require 0.1μF capacitors for 3.3V (5% tolerance) operation. For other supply voltages refer to Table 3 for capacitor values. Do not use values smaller than those listed in Table 3. Increasing the capacitor values (by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C_2, C_3, and C_4 can be increased without increasing C_1's value, however, do not increase C_1 without also increasing C_2, C_3, and C_4 to maintain the proper ratios (C_1 to the other capacitors).

When using minimum required capacitor values, make sure that capacitor values do not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR) usually rises at low temperatures and it influences the amount of ripple on V+ and V-.

TABLE 3. REQUIRED CAPACITOR VALUES

V_{CC} (V)	C_1 (μF)	C_2, C_3, C_4 (μF)
3.0 to 3.6 (3.3V ±10%)	0.22	0.22
3.15 to 3.6 (3.3V ±5%)	0.1	0.1
4.5 to 5.5	0.047	0.33
3.0 to 5.5	0.22	1.0

Power Supply Decoupling

In most circumstances a 0.1μF bypass capacitor is adequate. In applications that are particularly sensitive to power supply noise, decouple V_{CC} to ground with a

intersil

capacitor of the same value as the charge-pump capacitor C_1. Connect the bypass capacitor as close as possible to the IC.

Operation Down to 2.7V

ICL3237E transmitter outputs meet RS-562 levels (±3.7V), at the full data rate, with V_{CC} as low as 2.7V. RS-562 levels typically ensure inter operability with RS-232 devices.

Transmitter Outputs when Exiting Powerdown

Figure 4 shows the response of two transmitter outputs when exiting powerdown mode. As they activate, the two transmitter outputs properly go to opposite RS-232 levels, with no glitching, ringing, nor undesirable transients. Each transmitter is loaded with 3kΩ in parallel with 2500pF. Note that the transmitters enable only when the magnitude of the supplies exceed approximately 3V.
FIGURE 4. TRANSMITTER OUTPUTS WHEN EXITING POWERDOWN

High Data Rates

The ICL3237E maintains the RS-232 ±5V minimum transmitter output voltages even at high data rates. Figure 5 details a transmitter loopback test circuit, and Figure 6 illustrates the standard speed loopback test result for a single transmitter driving 1000pF and an RS-232 load at 250kbps. Figure 7 shows the MegaBaud loopback results for a single transmitter driving 250pF and an RS-232 load at 1Mbps. The static transmitters were also loaded with an RS-232 receiver.
FIGURE 5. TRANSMITTER LOOPBACK TEST CIRCUIT
FIGURE 6. LOOPBACK TEST AT 250kbps (C_L = 1000pF)
FIGURE 7. LOOPBACK TEST AT 1Mbps (C_L = 250pF)

Interconnection with 3V and 5V Logic

The ICL3237E directly interfaces with 5V CMOS and TTL logic families. Nevertheless, with the ICL32XX at 3.3V, and the logic supply at 5V, AC, HC, and CD4000 outputs can drive ICL32XX inputs, but ICL32XX outputs do not reach the minimum V_{IH} for these logic families. See Table 4 for more information.

TABLE 4. LOGIC FAMILY COMPATIBILITY WITH VARIOUS SUPPLY VOLTAGES

SYSTEM POWER-SUPPLY VOLTAGE (V)	V_{CC} SUPPLY VOLTAGE (V)	COMPATIBILITY
3.3	3.3	Compatible with all CMOS families.
5	5	Compatible with all TTL and CMOS logic families.
5	3.3	Compatible with ACT and HCT CMOS, and with TTL. ICL32XX outputs are incompatible with AC, HC, and CD4000 CMOS inputs.

±15kV ESD Protection

All pins on ICL32XX devices include ESD protection structures, but the ICL32XX*E* family incorporates advanced structures which allow the RS-232 pins (transmitter outputs and receiver inputs) to survive ESD events up to ±15kV. The RS-232 pins are particularly vulnerable to ESD damage because they typically connect to an exposed port on the exterior of the finished product. Simply touching the port pins, or connecting a cable, can cause an ESD event that might destroy unprotected ICs. These new ESD structures protect the device whether or not it is powered up, protect without allowing any latchup mechanism to activate, and don't interfere with RS-232 signals as large as ±25V.

Human Body Model (HBM) Testing

As the name implies, this test method emulates the ESD event delivered to an IC during human handling. The tester delivers the charge through a 1.5kΩ current limiting resistor, making the test less severe than the IEC61000 test which utilizes a 330Ω limiting resistor. The HBM method determines an ICs ability to withstand the ESD transients typically present during handling and manufacturing. Due to the random nature of these events, each pin is tested with respect to all other pins. The RS-232 pins on "E" family devices can withstand HBM ESD events to ±15kV.

IEC61000-4-2 Testing

The IEC61000 test method applies to finished equipment, rather than to an individual IC. Therefore, the pins most likely to suffer an ESD event are those that are exposed to the outside world (the RS-232 pins in this case), and the IC is tested in its typical application configuration (power applied) rather than testing each pin-to-pin combination. The lower current limiting resistor coupled with the larger charge storage capacitor yields a test that is much more severe than the HBM test. The extra ESD protection built into this device's RS-232 pins allows the design of equipment meeting level 4 criteria without the need for additional board level protection on the RS-232 port.

AIR-GAP DISCHARGE TEST METHOD

For this test method, a charged probe tip moves toward the IC pin until the voltage arcs to it. The current waveform delivered to the IC pin depends on approach speed, humidity, temperature, etc., so it is difficult to obtain repeatable results. The "E" device RS-232 pins withstand ±15kV air-gap discharges.

CONTACT DISCHARGE TEST METHOD

During the contact discharge test, the probe contacts the tested pin before the probe tip is energized, thereby eliminating the variables associated with the air-gap discharge. The result is a more repeatable and predictable test, but equipment limits prevent testing devices at voltages higher than ±8kV. All "E" family devices survive ±8kV contact discharges on the RS-232 pins.

NOTES:

8. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.

9. Dimensioning and tolerancing per ANSI Y14.5M-1982.

10. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.20mm (0.0078 inch) per side.

11. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.20mm (0.0078 inch) per side.

12. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.

13. "L" is the length of terminal for soldering to a substrate.

14. "N" is the number of terminal positions.

15. Terminal numbers are shown for reference only.

16. Dimension "B" does not include dambar protrusion. Allowable dambar protrusion shall be 0.13mm (0.005 inch) total in excess of "B" dimension at maximum material condition.

17. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.

All Intersil U.S. products are manufactured, assembled and tested utilizing ISO9000 quality systems.
