

ICM7555

General Purpose CMOS Timer

Product Specification

Linear Products

DESCRIPTION

The ICM7555 is a CMOS timer providing significantly improved performance over the standard NE/SE555 timer, while at the same time being a direct replacement for those devices in most applications. Improved parameters include low supply current, wide operating supply voltage range, low THRESHOLD, TRIGGER, and RESET currents, no crowbaring of the supply current during output transitions, higher-frequency performance and no requirement to decouple CONTROL VOLTAGE for stable operation.

The ICM7555 is a stable controller capable of producing accurate time delays or frequencies.

In the one-shot mode, the pulse width of each circuit is precisely controlled by one external resistor and capacitor. For astable operation as an oscillator, the free-running frequency and the duty cycle are both accurately controlled by two external resistors and one capacitor. Unlike the bipolar 555 device, the CONTROL VOLTAGE terminal need not be decoupled with a capacitor. The circuit is triggered and reset on falling (negative) waveforms, and the output inverter can source or sink currents large enough to drive TTL loads or provide minimal offsets to drive CMOS loads.

ORDERING INFORMATION

DESCRIPTION	TEMPERATURE RANGE	ORDER CODE
8-Pin Plastic DIP	0 to +70°C	ICM7555CN
8-Pin Plastic SO	0 to +70°C	ICM7555CD
8-Pin Plastic DIP	-40°C to +85°C	ICM7555IN
8-Pin Plastic SO	-40°C to +85°C	ICM7555ID
8-Pin Plastic DIP	-55°C to +125°C	ICM7555MN
8-Pin Ceramic DIP	-55°C to +125°C	ICM7555MFE

FEATURES

- Exact equivalent in most applications for NE/SE555
- Low supply current — 80 μ A (typ)
- Extremely low trigger, threshold, and reset currents — 20pA (typ)
- High-speed operation — 500kHz guaranteed
- Wide operating supply voltage range guaranteed 2 to 18V
- Normal reset function — no crowbaring of supply during output transition
- Can be used with higher-impedance timing elements than the bipolar 555 for longer time constants
- Timing from microseconds through hours
- Operates in both astable and monostable modes
- Adjustable duty cycle
- High output source/sink driver can drive TTL/CMOS
- Typical temperature stability of 0.005%/°C at 25°C
- Outputs have very low offsets, HI and LO

PIN CONFIGURATION

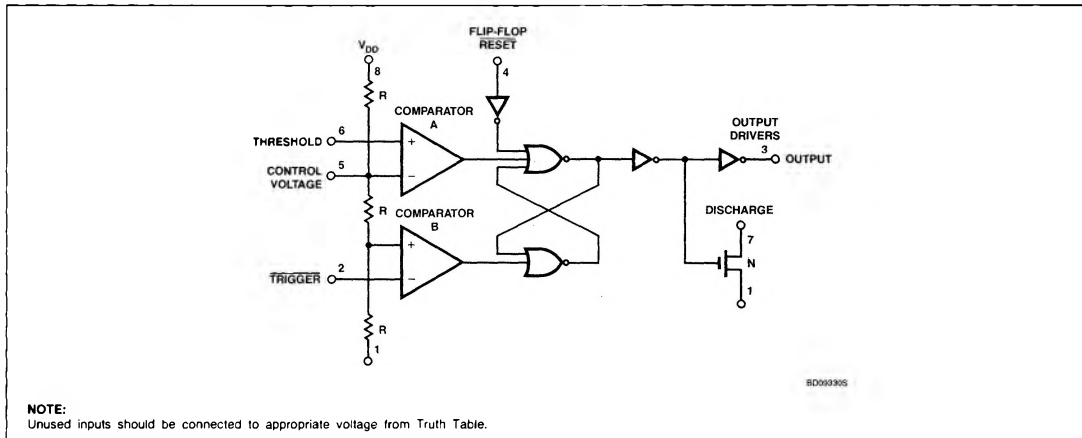

APPLICATIONS

- Precision timing
- Pulse generation
- Sequential timing
- Time delay generation
- Pulse width modulation
- Pulse position modulation
- Missing pulse detector

EQUIVALENT BLOCK DIAGRAM

TRUTH TABLE

THRESHOLD VOLTAGE	TRIGGER VOLTAGE	RESET ¹	OUTPUT	DISCHARGE SWITCH
DON'T CARE	DON'T CARE	LOW	LOW	ON
$> 2/3(V_+)$	$> 1/3(V_+)$	HIGH	LOW	ON
$V_{TH} < 2/3$	$V_{TR} > 1/3$	HIGH	STABLE	STABLE
DON'T CARE	$< 1/3(V_+)$	HIGH	HIGH	OFF

NOTE:
1. RESET will dominate all other inputs: TRIGGER will dominate over THRESHOLD.

ABSOLUTE MAXIMUM RATINGS¹

SYMBOL	PARAMETER	RATING	UNIT
V_{DD}	Supply voltage	+18	V
V_{TRIG}^1	Trigger input voltage	> -0.3 to $< V_{DD} + 0.3$	V
V_{CV}	Control voltage		
V_{TH}	Threshold input voltage		
V_{RST}	RESET input voltage		
I_{OUT}	Output current	100	mA
	Maximum power dissipation $T_A = 25^\circ\text{C}$ (still-air) ^{2, 3}		
	F package	780	mW
	N package	1160	mW
	D package	780	mW
T_{STG}	Storage temperature range	-65 to +150	°C
T_{SOLD}	Lead temperature (Soldering 60s)	300	°C

- NOTES:**
- Due to the SCR structure inherent in the CMOS process used to fabricate these devices, connecting any terminal to a voltage greater than $V_{DD} + 0.3V$ or less than $GND - 0.3V$ may cause destructive latchup. For this reason it is recommended that no inputs from external sources not operating from the same power supply be applied to the device before its power supply is established. In multiple systems, the supply of the ICM7555 must be turned on first.
 - Derate above 25°C , at the following rates:
 F package at $6.2\text{mW}/^\circ\text{C}$
 N package at $9.3\text{mW}/^\circ\text{C}$
 D package at $6.2\text{mW}/^\circ\text{C}$
 - See "Power Dissipation Considerations" section.

f_{MAX}	Maximum oscillator frequency (astable mode)		500			500			kHz

NOTES:

1. The supply current value is essentially independent of the TRIGGER, THRESHOLD, and RESET voltages.

2. Astable timing is calculated using the following equation: $f = \frac{1.38}{(R_A + 2R_B)C}$. The components are defined in Figure 2.

3. Parameter is not 100% tested.

APPLICATION NOTES

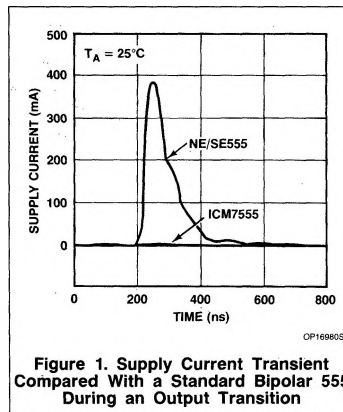

General

The ICM7555 device is, in most instances, a direct replacement for the NE/SE555 device. However, it is possible to effect economies in the external component count using the ICM7555. Because the bipolar 555 device produces large crowbar currents in the output driver, it is necessary to decouple the power supply lines with a good capacitor close to the device. The 7555 device produces no such transients. See Figure 1.

The ICM7555 produces supply current spikes of only 2-3mA instead of 300-400mA and supply decoupling is normally not necessary. Secondly, in most instances, the CONTROL VOLTAGE decoupling capacitors are not required since the input impedance of the CMOS comparators on chip are very high. Thus, for many applications, 2 capacitors can be saved using an ICM7555.

Power Supply Considerations

Although the supply current consumed by the ICM7555 device is very low, the total system supply can be high unless the timing compo-

OP168805

Figure 1. Supply Current Transient Compared With a Standard Bipolar 555 During an Output Transition

nents are high impedance. Therefore, use high values for R and low values for C in Figures 2 and 3.

Output Drive Capability

The output driver consists of a CMOS inverter capable of driving most logic families including CMOS and TTL. As such, if driving CMOS, the output swing at all supply voltages will equal the supply voltage. At a supply voltage of 4.5V or more, the ICM7555 will drive at least 2 standard TTL loads.

Astable Operation

If the circuit is connected as shown in Figure 2, it will trigger itself and free run as a multivibrator. The external capacitor charges through R_A and R_B and discharges through R_B only. Thus, the duty cycle (D) may be precisely set by the ratio of these two resistors. In this mode of operation, the capacitor charges and discharges between $1/3 V_{DD}$ and $2/3 V_{DD}$. Since the charge rate and the threshold levels are directly proportional to the supply voltage, the frequency of oscillation is independent of the supply voltage.

$$F = \frac{1.38}{(R_A + 2R_B)} C \quad D = \frac{R_A + R_B}{R_A + 2R_B}$$

General Purpose CMOS Timer

ICM7555

Monostable Operation

In this mode of operation, the timer functions as a one-shot. Initially, the external capacitor (C) is held discharged by a transistor inside the timer. Upon application of a negative TRIGGER pulse to Pin 2, the internal flip-flop is set which releases the short circuit across the external capacitor and drives the OUTPUT High. The voltage across the capacitor now increases exponentially with a time constant $t = R_A C$. When the voltage across the capacitor equals $2/3 V^+$, the comparator resets the flip-flop, which in turn discharges the capacitor rapidly and also drives the OUTPUT to its low state. TRIGGER must return to a high state before the OUTPUT can return to a low state.

Control Voltage

The CONTROL VOLTAGE terminal permits the two trip voltages for the THRESHOLD and TRIGGER internal comparators to be controlled. This provides the possibility of oscillation frequency modulation in the astable mode, or even inhibition of oscillation, depending on the applied voltage. In the monostable mode, delay times can be changed by varying the applied voltage to the CONTROL VOLTAGE pin.

RESET

The RESET terminal is designed to have essentially the same trip voltage as the standard bipolar 555, i.e., 0.6 to 0.7V. At all supply voltages it represents an extremely high input impedance. The mode of operation of the RESET function is, however, much improved over the standard bipolar 555 in that it controls only the internal flip-flop, which in turn controls simultaneously the state of the OUTPUT and DISCHARGE pins. This avoids the multiple threshold problems sometimes encountered with slow falling edges in the bipolar devices.
