# IMS1600M IMS1601LM CMOS

## High Performance 64K x 1 Static RAM MIL-STD-883C

### FEATURES

- INMOS' Very High Speed CMOS
- Advanced Process - 1.6 Micron Design Rules
- Full Military Temperature Operating Range (-55°C to +125°C)
- MIL-STD-883C Processing
- 45, 55, and 70 nsec Access Times
- Fully TTL Compatible
- Separate Data Input & Output
- Three-state Output
- Power Down Function
- Single +5V ± 10% Operation
- Standard Military Drawing version available
- 22-Pin, 300-mil DIP (JEDEC Std.)
- 22-Pin Ceramic LCC (JEDEC Std.)
- Battery Backup Operation - 2V Data Retention (L version only)

### DESCRIPTION

The INMOS IMS1600M is a high performance 64Kx1 CMOS Static RAM processed in full compliance to MIL-STD-883C and guaranteed to operate over the full military temperature range. The IMS1600M provides maximum density and speed enhancements with the additional CMOS benefits of lower power and superior reliability.

The IMS1600M features fully static operation requiring no external clocks or timing strobes, and equal address access and cycle times. Additionally, the IMS1600M provides a Chip Enable (/E) function that can be used to place the device into a low-power standby mode.

The IMS1601LM is a low power version offering battery backup data retention operating from a 2 volt supply.

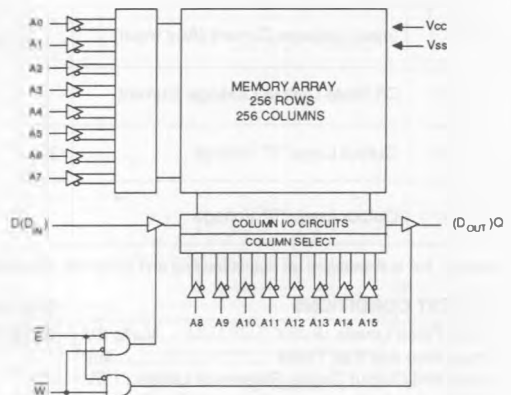

### PIN CONFIGURATION

### BLOCK DIAGRAM

### PIN NAMES

A <sub>0</sub> - A <sub>15</sub> ADDRESS INPUTS	O DATA OUTPUT
W WRITE ENABLE	V <sub>CC</sub> POWER (+5V)
E CHIP ENABLE	V <sub>SS</sub> GROUND
D DATA INPUT	

**ABSOLUTE MAXIMUM RATINGS\***

Voltage on any pin relative to V<sub>ss</sub>.....-2.0 to 7.0V  
 Voltage on Q.....-1.0 to (V<sub>cc</sub>+0.5)  
 Temperature Under Bias.....-55° C to 125°C  
 Storage Temperature .....-65° C to 150°C  
 Power Dissipation.....1W  
 DC Output Current.....25mA  
 (One Second Duration)

\*Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**DC OPERATING CONDITIONS**

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS	NOTES
V <sub>cc</sub>	Supply Voltage	4.5	5.0	5.5	V

Note i: If  $\bar{W}$  is low when  $\bar{E}$  goes low, the output remains in the high impedance state.

Note j: Parameter guaranteed but not tested.

## WRITE CYCLE 2

## DEVICE OPERATION

The IMS1600M has two control inputs, a Chip Enable (/E) and Write Enable (/W), 16 address inputs (A0 -A15), a data in (D) and a data out (Q).

The /E input controls device selection as well as active and standby modes. With /E low, the device is selected and the 16 address inputs are decoded to select one memory cell out of 65,536. Read and Write operations on the memory cell are controlled by the /W input. With /E high, the device is deselected, the output is disabled and the power consumption is reduced to less than one-third of the active mode power with TTL levels and even lower with CMOS levels.

### READ CYCLE

A read cycle is defined as  $/W \geq V_{IH\ min}$  with  $/E \leq V_{IL\ max}$ . Read access time is measured from either /E going low or from valid address.

The READ CYCLE 1 waveform shows a read access that is initiated by a change in the address inputs while /E is low. The output remains active throughout READ CYCLE 1 and is valid at the specified address access time. The address inputs may change at access time and long as /E remains low, the cycle time is equal to the address access time.

The READ CYCLE 2 waveform shows a read access that is initiated by /E going low. As long as address is stable when /E goes low, valid data is at the output at the specified Chip Enable Access time. If address is not valid when /E goes low, the timing is as specified in READ CYCLE 1. Chip Enable access time is not affected by the duration of the deselect interval.

### WRITE CYCLE

The write cycle of the IMS1600M is initiated by the latter of /E or /W to transition from a high to a low. In the case of /W falling last, the output buffer will be turned on  $t_{EOL}$  after the falling edge of /E (just as in a read cycle). The output buffer is then turned off within  $t_{WOL}$  of the falling edge of /W. During this interval it is possible to have bus contention between devices with D and Q connected together in a common I/O configuration. To avoid bus contention input data should not be active until  $t_{WOL}$ .

WRITE CYCLE 1 waveform shows a write cycle terminated by /W going high. Data set-up and hold times are referenced to the rising edge of /W. When /W goes high at the end of the cycle with /E active, the output of the memory becomes active. The data from the memory will be the same as the input data unless the input data or address changes.

WRITE CYCLE 2 waveform shows a write cycle terminated by /E going high. Data set-up and hold times are referenced to the rising edge of /E. With /E high the output remains in the high impedance state.

## POWER DISTRIBUTION

The recommended power distribution scheme combines proper power trace layout and placement of decoupling capacitors to maintain the operating margins of the IMS1600M. The impedance in the decoupling path from the power pin through the decoupling capacitor to the ground pin should be kept to a minimum. The impedance of this path is determined by the series impedance of the power line inductance and the inductance and reactance of the decoupling capacitor.

Current transients associated with the operation of any high speed device have very high frequency components, so line inductance is the dominating factor. To reduce the line inductance, the power trace and ground trace should be gridded or provided by separate power planes. The decoupling capacitor supplies energy for high frequency current transients and should be located as close to the devices with as short lead length as possible. The high frequency decoupling capacitor should have a value of 0.1 microfarad and be placed between each row of devices in the array. A larger tantalum capacitor of a sufficient value to eliminate low frequency ripple, should be placed near the memory board edge connection where the power traces meet the backplane power distribution system. These larger capacitors provide bulk energy storage to prevent voltage drop due to the main supply being located off the memory board and at the end of a long inductive path. The ground grid of the memory array should extend to the TTL driver periphery circuit area. This will provide a solid ground reference for the TTL drivers and prevent loss of operating margin of the drivers due to differential ground noise.

**TERMINATION**

Trace lines on a memory board in the array look to TTL driver signals like low impedance, unterminated transmission lines. In order to reduce or eliminate the reflections of the TTL signals propagating down the lines, especially low going TTL signals, line termination is recommended. The termination may be either series or parallel.

The recommended technique is to use series termination. The series termination technique has the advantage of drawing no DC current and using a minimum number of components. This is accomplished by placing a series resistor in the signal line at the output of the TTL driver to

dampen the reflection on the line. The resistor should be placed as close to the driver package as is practical. The line should be kept short by placing the driver-termination combination close to the memory array.

Some experimentation will have to be done to find the proper value to use for the series termination to minimize reflections, but generally a series resistor in the 10 to 33 ohm range will be required. Because each design will result in a different signal impedance, a resistor of predetermined value may not properly match the signal path impedance. The proper value of resistance should therefore be selected empirically.

**DATA RETENTION** (L version only) ( $-55^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ )

SYMBOL	PARAMETER	MIN	TYP*	MAX	UNITS	NOTES
