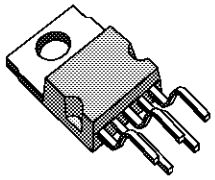
SGS-THOMSON MICROELECTRONICS

L4918

VOLTAGE REGULATORS PLUS FILTER

PRELIMINARY DATA

- FIXED OUTPUT VOLTAGE 8.5V
- 250mA OUTPUT CURRENT
- HIGH RIPPLE REJECTION
- HIGH LOAD REGULATION
- HIGH LINE REGULATION
- SHORT CIRCUIT PROTECTION
- THERMAL SHUT DOWN WITH HYSTERESIS
- DUMP PROTECTION



PENTAWATT

ORDERING NUMBER : L4918

DESCRIPTION

The L4918 combines both a filter and a voltage regulator in order to provide a high ripple rejection over a wider input voltage range.

A supervisor low-pass loop of the element prevents the output transistor from saturation at low input vol tages.

The non linear behaviour of this control circuitry allows a fast setting of the filter.

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_i	Peak Input Voltage (300 ms)	40	V
V_i	DC Input Voltage	28	V
I_O	Output Current	Internally Limited	
P_{tot}	Power Dissipation	Internally Limited	
T_{stg}, T_j	Storage and Junction Temperature	– 40 to 150	°C

THERMAL DATA

Symbol	Parameter		Value	Unit
$R_{th\ j\text{-}case}$	Thermal Resistance Junction-case	Max	4	°C/W

ELECTRICAL CHARACTERISTICS (T_{amb} = 25 °C; V_i = 13.5 V, unless otherwise specified)

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
V_i	Input Voltage				20	V
V_O	Output Voltage	V_i = 12 to 18 V I_O = 5 to 150 mA	8.1	8.5	8.9	V
$\Delta V_{I/O}$	Controlled Input-output Dropout Voltage	V_i = 5 to 10 V I_O = 5 to 150 mA		1.6	2.1	V
ΔV_O	Line Regulation	V_i = 12 to 18 V I_O = 10 mA		1	20	mV
ΔV_O	Load Regulation	I_O = 5 to 250 mA t_{on} = 30 µs t_{off} = ≥ 1 ms			100	mV
ΔV_O	Load Regulation (filter mode)	V_i = 8.5 V I_O = 5 to 150 mA t_{on} = 30 µs t_{off} = ≥ 1 ms		150	250	mV
I_q	Quiescent Current	I_O = 5 mA		1	2	mA
ΔI_q	Quiescent Current Change	V_i = 6 to 18 V I_O = 5 to 150 mA		0.05		mA
$\frac{\Delta V_O}{\Delta T}$	Output Voltage Drift	I_O = 10 mA		1.2		mV/°C
SVR	Supply Voltage Rejection	V_{iac} = 1 V_{rms} f = 100 Hz I_O = 150 mA V_{IDC} = 12 to 18 V V_{IDC} = 6 to 11 V		 71 35(*)		 dB dB
I_{SC}	Short Circuit Current		250	300		mA
t_{on}	Switch On Time	I_O = 150 mA V_i = 5 to 11 V V_i = 11 to 18 V		 500(*) 300		 ms ms
T_{JSD}	Thermal Shutdown Junction Temperature			150		°C

(*) Depending of the C_{FT} capacitor

PRINCIPLE OF OPERATION

During normal operation (input voltage upper than $V_{I\,MIN} = V_{OUT\,NOM} + \Delta V_{I/O}$). The device works as a normal voltage regulator built around the OP1 of the block diagram.

The series pass element use a PNP-NPN connection to reduce the dropout. The reference voltage of the OP1 is derived from a REF through the OP2 and Q3, acting as an active zener diode of value V_{REF}.

In this condition the device works in the range (1) of the characteristic of the non linear drop control unit (see fig.2).

The output voltage is fixed to its nominal value:

$$V_{OUT\,NOM} = V_{REF}\ (1 + \frac{R1}{R2}) = V_{CFT}\ (1 + \frac{R1}{R2})$$

$$\frac{R1}{R2} = \text{INTERNALLY FIXED RATIO} = 2.4$$

The ripple rejection is quite high (71 dB) and independent from C_{FT} value.

On the usual voltage regulators, when the input voltage goes below the nominal value, the regulation transistors (series element) saturate bringing the system out of regulation making it very sensible to every variation of the input voltage. Onthe contrary, a control loop on the L4918 consents to avoid the saturation of the series element by regulating the value of the reference voltage (pin 2). In fact, whenever the input voltage decreases below $V_{I\,MIN}$ the supervisor loop, utilizing a non linear OTA, forces the reference voltage at pin 2 to decrease by discharging C_{FT}. So, during the static mode, when the input voltage goes below V_{MIN} the drop out is kept fixed to about 1.6 V. In this condition the device works as a low pass filter in the range (2) of the OTA charac-

teristic. The ripple rejection is externally adjustable acting on C_{FT} as follows:

$$SVR\ (jw) = \left|\frac{V_I\ (jw)}{V_{out}\ (jw)}\right| =$$

$$1 + \left| \frac{10^{-6}}{\frac{gm}{jwC_{FT}}\ (1 + \frac{R1}{R_2}\ )} \right|$$

Where:

$gm = 2 \cdot 10^{-5}\ \Omega^{-1}$ = OTA'S typical transconductance value on linear region

$\frac{R1}{R2}$ = fixed ratio

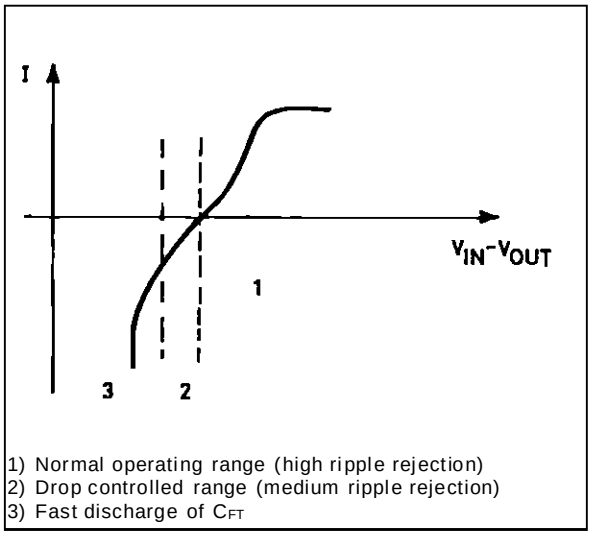
C_{FT} = value of capacitor in µF

The reaction time of the supervisor loop is given by the transconductance of the OTA and by C_{FT}. When the value of the ripple voltage is so high and its negative peak is fast/enough to determine an istantaneous decrease of the dropout till 1.2V, the OTA works in a higher transconductance condition [range (3) of the characteristic] and discharge the capacitor rapidously.

If the ripple frequency is high enough the capacitor won't charge itself completely, and the output voltage reaches a small value allowing a better ripple rejection; the device's again working as a filter (fast transient range).

With $C_{FT} = 10\ \mu F$; f = 100 Hz a SVR of 35 is obtained.

Figure 2 : Nonliner Transfer Characteristic of the Drop Control Unit.



1) Normal operating range (high ripple rejection)
2) Drop controlled range (medium ripple rejection)
3) Fast discharge of C_{FT}
