DATA SHEET

An ON Semiconductor Company

Driver with Key Input Function

Overview

The LC75806PT is 1/4 duty and 1/3 duty LCD display driver that can directly drive up to 304 segments and can control up to 9 general-purpose output ports. This product also incorporates a key scan circuit that accepts input from up to 30 keys to reduce printed circuit board wiring.

Features

- Key input function for up to 30 keys (A key scan is performed only when a key is pressed.)
- 1/4 duty 1/3 bias and 1/3 duty 1/3 bias drive schemes can be controlled from serial data.
- Capable of driving up to 304 segments using 1/4 duty and up to 231 segments using 1/3 duty.
- Switching between key scan output and segment output can be controlled from serial data.
- The key scan operation enabled/disabled state can be controlled from serial data.
- Switching between segment output port and general-purpose output port can be controlled from serial data.
- Switching between general-purpose output port, clock output port, and segment output port can be controlled from serial data. (Up to 9 general-purpose output ports and up to one clock output port)
- Serial data I/O supports CCB format communication with the system controller. (Support 3.3V and 5V operation)
- Sleep mode and all segments off functions that are controlled from serial data.
- The frame frequency of the common and segment output waveforms can be controlled from serial data.
- Switching between RC oscillator operating mode and external clock operationg mode can be controlled from serial data.
- Direct display of display data without the use of a decoder provides high generality.
- Built-in display contrast adjustment circuit.
- Provision of an on-chip voltage-detection type reset circuit prevents incorrect displays.
- RES pin provided for forcibly initializing the IC internal circuits.
 - CCB is a registered trademark of SANYO Semiconductor Co., Ltd.
 - CCB is SANYO Semiconductor's original bus format. All bus addresses are managed by SANYO Semiconductor for this format.
 - Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.
 - Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Specifications

Absolute Maximum Ratings at Ta = 25°C, $V_{SS} = 0V$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V _{DD} max	V _{DD}	-0.3 to +7.0	V
land to the second	V _{IN} 1	CE, CL, DI, RES	-0.3 to +7.0	.,,

Pin Assignment

Block Diagram

Pin Functions

Symbol	Pin No.	Function	Active	I/O	Handling when unused
S1/P1 to S8/P8 S9 to S73	1 to 8 9 to 73	Segment outputs for displaying the display data transferred by serial data input. The S1/P1 to S8/P8 pins can be used as general-purpose output ports under serial data control.	-	0	OPEN
COM1 to COM3 COM4/S74	77 to 75 74	Common driver outputs. The frame frequency is fo[Hz]. The COM4/S74 pin can be used as a segment output in 1/3 duty.	-	0	OPEN
KS1/S75 KS2/S76 KS3 to KS6	78 79 80 to 83	Key scan outputs. Although normal key scan timing lines require diodes to be inserted in the timing lines to prevent shorts, since these outputs are unbalanced CMOS transistor outputs, these outputs will not be damaged by shorting when these outputs are used to form a key matrix. The KS1/S75 and KS2/S76 pins can be used as segment outputs when so specified by the control data.	-	0	OPEN
KI1 to KI5	84 to 88	Key scan inputs. These pins have built-in pull-down resistors.	Н	I	GND
P9/S77	89	General-purpose output port. This pin can be used as clock output port or segment output port under serial data control.	-	0	OPEN
OSC	95	Oscillator connections. An oscillator circuit is formed by connecting an external resistor and capacitor at this pin. This pin can also be used as the external clock input pin if the external clock operating mode is selected with the control data.	-	I/O	V _{DD}
CE	98	Serial data interface connections to the controller. Note that DO, being an open-drain output, requires a pull-up resistor.	Н	ı	
CL	99	CE: Chip enable		I	GND
DI	100	CL: Synchronization clock DI: Transfer data	-	I	
DO	97	DO: Output data	-	0	OPEN
RES	96	RES=Low Display off - S1/P1 to S8/P8, KS1/S75, KS2/S76=Low (These pins are forcibly set to the segment output port function and fixed at the low level.) - S9 to S73=Low - COM1 to COM3=Low - COM4/S74=Low (This pin is forcibly set to the common output function and fixed at the low level.) - P9/S77=Low (This pin is forcibly set to the general-purpose output port function and fixed at the low level.) - KS3 to KS6=Low - Key scanning disabled - All the key data is reset to low OSC="Z"(High impedance) - RC oscillation stopped - Inhibits external clock input - Display contrast adjustment circuit stopped. RES=High Display on - General-purpose output port state setting is enabled - Key scanning is enabled RC oscillation enabled (RC oscilltator operating mode) - Enables external clock input (external clock operating mode) - Display contrast adjustment circuit operation is enabled.	L	I	V _{DD}
TEST	94	However, serial data can be transferred when the RES pin is low This pin must be connected to ground.	-	ı	-
V _{DD} 1	91	LCD drive 2/3 bias voltage (middle level) supply pin. This pin can be used to	-	ı	OPEN
V _{DD} 2	92	supply the 2/3 V _{DD} 0 voltage level externally. LCD drive 1/3 bias voltage (middle level) supply pin. This pin can be used to supply the 1/3 V _{DD} 0 voltage level externally.	-	ı	OPEN
V _{DD}	90	Power supply connections. Provide a voltage of between 4.5 to 6.0V.	-	-	-
V _{SS}	93	Power supply connections. Connect to ground.	-	-	-

Control Data Functions

1. OC ...RC oscillator operating mode/external clock operating mode switching control data

This control data bit selects the OSC pin function (RC oscillator operating mode or external clock operating mode)

ОС	OSC pin function
0	RC oscillator operating mode
1	External clock operating mode

Note: If RC oscillator operating mode is selected, connect an external resistor ROSC and an external capacitor COSC to the OSC pin.

2. PC90, PC91 ... General-purpose output port/clock output port/segment output port switching control data These control data bits swithes the functions of the P9/S77 output pin between the general-purpose output port, the clock output port, and the segment output port.

Control data		The state of DO/C77 output pin				
PC90	PC91	The state of P9/S77 output pin				
0	0	General-purpose output port (P9) ("L" level output)				
1	0	General-purpose output port (P9) ("H" level output)				
0	1	Clock output port (P9) (Clock frequency is f _{OSC} /2 or f _{CK} /2)				
1	1	Segment output port (S77)				

Note: If the sleep mode is set, the P5/S57 output pin can not be used as the clock output port.

3. S0, S1 ... Sleep control data

These control data bits switch between normal mode and sleep mode, and set the states of the KS1 to KS6 key scan output during key scan standby.

Contro	ol data		OSC pin state	Segment		Output p	in states dur	ing key scan	standby	
S0	S1	Mode	(RC oscillator or acceptance of the external clock signal)	KS1	KS2	KS3	KS4	KS5	KS6	
0	0	Normal	Operating	Operating	Н	Н	Н	Н	Н	Н
0	1	Sleep	Stopped	L	L	L	L	L	L	Н
1	0	Sleep	Stopped	L	L	L	L	L	Н	Н
1	1	Sleep	Stopped	L	Н	Н	Н	Н	Н	Н

Note: This assumes that the KS1/S75 and KS2/S76 output pins are selected for key scan output.

$4.\;K0,\,K1\,\ldots\,Key\;scan\;output/segment\;output\;switching\;control\;data$

These control data bits switch the functions of the KS1/S75 and KS2/S76 output pins between the key scan output and the segment output.

Contro	ol data	Output	oin state	Maximum number
K0	K1	KS1/S75	KS2/S56	of input keys
0	0	KS1	KS2	30
0	1	S75	KS2	25
1	Х	S75	S76	20

X: don't care

Note: KSn (n=1 or 2): Key scan output Sn (n=75 or 76): Segment output 5. P0 to P3 ... Segment output port/general-purpose output port switching control data

These control data bits switch the functions of the S1/P1 to S8/P8 output pins between the segment output port and

the general-purpose output port.

	Control data Output pin state										
P0	P1	P2	P3	S1/P1	S2/P2	S3/P3	S4/P4	S5/P5	S6/P6	S7/P7	S8/P8
0	0	0	0	S1	S2	S3	S4	S5	S6	S7	S8
0	0	0	1	P1	S2	S3	S4	S5	S6	S7	S8
0	0	1	0	P1	P2	S3	S4	S5	S6	S7	S8
0	0	1	1	P1	P2	P3	S4	S5	S6	S7	S8
0	1	0	0	P1	P2	P3	P4	S5	S6	S7	S8
0	1	0	1	P1	P2	P3	P4	P5	S6	S7	S8
0	1	1	0	P1	P2	P3	P4	P5	P6	S7	S8
0	1	1	1	P1	P2	P3	P4	P5	P6	P7	S8
1	0	0	0	P1	P2	P3	P4	P5	P6	P7	P8

Note: Sn (n=1 to 8): Segment output port

Pn (n=1 to 8): General-purpose output port

The table below lists the correspondence between the display data and the output pins when these pins are selected to

be general-purpose output ports.

Outrat ala	Correspondence display data				
Output pin	1/4 duty	1/3 duty			
S1/P1	D1	D1			
S2/P2	D5	D4			
S3/P3	D9	D7			
S4/P4	D13	D10			
S5/P5	D17	D13			
S6/P6	D21	D16			
S7/P7	D25	D19			
S8/P8	D29	D22			

For example, if the circuit is operated in 1/4 duty and the S4/P4 output pin is selected to be a general-purpose output port, the S4/P4 output pin will output a high level when the display data D13 is 1, and will output a low level when D13 is 0.

6. SC ... Segment on/off control data

This control data bit controls the on/off state of the segments.

SC	Display state		
0	On		
1	Off		

However, note that when the segments are turned off by setting SC to 1, the segments are turned off by outputting segment off waveforms from the segment output pins.

7. KSC ... Key scan operation enabled/disabled state setting control data

This control data bit enables or disables key scan operation.

KSC	Key scan operating state
0	Key scan operation enabled (A key scan operation is performed if any key on the lines corresponding to KS1 to KS6 pin which is set high is pressed.)
1	Key scan operation disabled (No key scan operation is performed, even if any of the keys in the key matrix are pressed. If this state is set up, the key data is forcibly reset to 0 and the key data read request is also cleared. (DO is set high.))

8. FC0 to FC2 ... Common and segment output waveform frame frequency control data These control data bits set the common and segment output waveform frequency.

C	Control dat	а	Frame frequency
FC0	FC1	FC2	f _O [Hz]
1	1	0	f _{OSC} /768, f _{CK} /768
1	1	1	f _{OSC} /576, f _{CK} /576
0	0	0	f _{OSC} /384, f _{CK} /384
0	0	1	f _{OSC} /288, f _{CK} /288
0	1	0	f _{OSC} /192, f _{CK} /192

9. CT0 to CT2 ... Display contrast setting control data Set the display contrast with this control data.

CT0 to CT2: Sets the display contrast (7 steps)

CT0	CT1	CT2	LCD drive 3/3 bias voltage V _{DD} 0 level		
0	0	0	1.00V _{DD} =V _{DD} -(0.05V _{DD} ×0)		
1	0	0	0.95V _{DD} =V _{DD} -(0.05V _{DD} ×1)		
0	1	0	$0.90V_{DD} = V_{DD} - (0.05V_{DD} \times 2)$		
1	1	0	$0.85V_{DD} = V_{DD} - (0.05V_{DD} \times 3)$		
0	0	1	0.80V _{DD} =V _{DD} -(0.05V _{DD} ×4)		
1	0	1	0.75V _{DD} =V _{DD} -(0.05V _{DD} ×5)		
0	1	1	0.70V _{DD} =V _{DD} -(0.05V _{DD} ×6)		

Note that although the display contrast can be adjusted by operating the built-in display contrast adjustment circuit, it can also be adjusted by modifying the supply pin V_{DD} voltage level.

Note: This is for the case where the S1/P1 to S8/P8, KS1/S75, KS2/S76, P9/S77 output pins are selected for use as segment outputs.

For example, the table below lists the segment output states for the S11 output pin.

	Display data			Output via retain (OAA)	
D41	D42	D43	D44	Output pin state (S11)	
0	0	0	0	The LCD segments for COM1, COM2, COM3 and COM4 are off.	
0	0	0	1	The LCD segment for COM4 is on.	
0	0	1	0	The LCD segment for COM3 is on.	
0	0	1	1	The LCD segments for COM3 and COM4 are on.	
0	1	0	0	The LCD segment for COM2 is on.	
0	1	0	1	The LCD segments for COM2 and COM4 are on.	
0	1	1	0	The LCD segments for COM2 and COM3 are on.	
0	1	1	1	The LCD segments for COM2, COM3 and COM4 are on.	
1	0	0	0	The LCD segment for COM1 is on.	
1	0	0	1	The LCD segments for COM1 and COM4 are on.	
1	0	1	0	The LCD segments for COM1 and COM3 are on.	
1	0	1	1	The LCD segments for COM1, COM3 and COM4 are on.	
1	1	0	0	The LCD segments for COM1 and COM2 are on.	
1	1	0	1	The LCD segments for COM1, COM2 and COM4 are on.	
1	1	1	0	The LCD segments for COM1, COM2 and COM3 are on.	
1	1	1	1	The LCD segments for COM1, COM2, COM3 and COM4 are on.

	P9/S77	D229	D230	D231

Note: This is for the case where the S1/P1 to S8/P8, KS1/S75, KS2/S76, P9/S77 output pins are selected for use as segment outputs.

For example, the table below lists the segment output states for the S11 output pin.

	Display data		Output pin state (C44)		
D31	D32	D33	Output pin state (S11)		
0	0	0	The LCD segments for COM1, COM2, and COM3 are off.		
0	0	1	The LCD segment for COM3 is on.		
0	1	0	The LCD segment for COM2 is on.		
0	1	1	The LCD segments for COM2 and COM3 are on.		
1	0	0	The LCD segment for COM1 is on.		
1	0	1	The LCD segments for COM1 and COM3 are on.		
1	1	0	The LCD segments for COM1 and COM2 are on.		
1	1	1	The LCD segments for COM1, COM2 and COM3 are on.		

Serial Data Output

2. When CL is stopped at the high level

- CCB address ····· "43H"
- KD1 to KD30 ····· Key data
- SA ····· Sleep acknowledge data

Note: If a key data read operation is executed when DO is high (DO does not generate a key data read request output), the read key data (KD1 to KD30) and sleep acknowledge data (SA) will be invalid.

Output Data

1. KD1 to KD30 ... Key data

When a key matrix of up to 30 keys is formed from the KS1 to KS6 output pins and KI1 to KI5 input pins and one of those keys is pressed, the key output data corresponding to that key will be set to 1. The table shows the relationship between those pins and the key data bits.

	KI1	KI2	KI3	KI4	KI5
KS1/S75	KD1	KD2	KD3	KD4	KD5
KS2/S76	KD6	KD7	KD8	KD9	KD10
KS3	KD11	KD12	KD13	KD14	KD15
KS4	KD16	KD17	KD18	KD19	KD20
KS5	KD21	KD22	KD23	KD24	KD25
KS6	KD26	KD27	KD28	KD29	KD30

When the KS1/S75 and KS2/S76 output pins are selected to be segment outputs by control data bits K0 and K1 and a key matrix of up to 20 keys is formed using the KS3 to KS6 output pins and the KI1 to KI5 input pins, the KD1 to KD10 key data bits will be set to 0.

2. SA ... Sleep acknowledge data

This output data bit is set to the state when the key was pressed. Also, while DO will be low in this case, if serial data is input and the mode is set (to normal or sleep mode) during this period, that mode will be set. SA will be 1 in sleep mode and 0 in normal mode.

Sleep Mode Functions

Sleep mode is set up by setting S0 or S1 in the control data to 1. When sleep mode is set up, both the segment and common outputs will go to the low level. In RC oscillator operating mode (OC=0), the oscillator on the OSC pin will stop (although it will operate during key scan operations), and in exeternal clock operating mode (OC=1), acceptance of the external clock signal on the OSC pin will stop (although the clock signal will be accepted during key scan operations). Thus this mode reduces power consumption. However, the S1/P1 to S8/P8, P9/S77 output pins can be used as general-purpose output ports under control of the P0 to P3, PC90 and PC91 bits in the control data even in sleep mode (The P9/S77 output pin can not be used as clock output port). Sleep mode is cancelled by setting both S0 and S1 in control data to 0.

Key Scan Operation Functions

1. Key scan timing

The key scan period is 288T[s]. To reliably determine the on/off state of the keys, the LC75806PT scans the keys twice and determines that a key has been pressed when the key data agrees. It outputs a key data read request (a low level on DO) 615T[s] after starting a key scan. If the key data does not agree and a key was pressed at that point, it scans the keys again. Thus the LC75806PT cannot detect a key press shorter than 615T[s].

Note: *4. These are set to the high or low level by the S0 and S1 bits in the control data. Key scan output signals are not output from pins that are set to the low level.

- 2. Normal mode, when key scan operations are enabled
- (1) The KS1 to KS6 pins are set high. (See the description of the control data.)
- (2) When a key is pressed, a key scan is started and the keys are scanned until all keys are released. Multiple key presses are recognized by determining whether multiple key data bits are set.
- (3) If a key is pressed for longer than 615T[s] (Where T=1/f_{OSC} or T=1/f_{CK}), the LC75806PT outputs a key data read request (a low level on DO) to the controller. The controller acknowledges this request and reads the key data. However, if CE is high during a serial data transfer, DO will be set high.
- (4) After the controller reads the key data, the key data read request is cleared (DO is set high) and the LC75806PT performs another key scan. Also note that DO, being an open-drain output, requires a pull-up resistor (between 1 and $10k\Omega$).

- 3. Sleep mode, when key scan operations are enabled
- (1) The KS1 to KS6 pins are set to high or low level by the S0 and S1 bits in the control data. (See the description of the control data.)
- (2) If a key on one of the lines corresponding to a KS1 to KS6 pin which is set high is pressed, the oscillator on the OSC pins starts in RC oscillator operating mode (the IC starts accepting the external clock signal in external clock operating mode) and a key scan is performed. Keys are scanned until all keys are released. Multiple key presses are recognized by determining whether multiple key data bits are set.
- (3) If a key is pressed for longer than 615T[s] (Where T=1/f_{OSC} or T=1/f_{CK}), the LC75806PT outputs a key data read request (a low level on DO) to the controller. The controller acknowledges this request and reads the key data. However, if CE is high during a serial data transfer, DO will be set high.
- (4) After the controller reads the key data, the key data read request is cleared (DO is set high) and the LC75806PT performs another key scan. However, this does not clear sleep mode. Also note that DO, being an open-drain output, requires a pull-up resistor (between 1 and $10k\Omega$).
- (5) Sleep mode key scan example

Example: S0=0, S1=1 (Sleep with only KS6 high)

When any one of these keys is pressed, the oscillator on the OSC pins starts in RC oscillator operating mode (the IC starts accepting the external clock signal in external clock operating mode) and a key scan operation is performed.

Note: *5. These diodes are required to reliably recognize multiple key presses on the KS6 line when sleep mode state with only KS6 high, as in the above example. That is, these diodes prevent incorrect operations due to sneak currents in the KS6 key scan output signal when keys on the KS1 to KS5 lines are pressed at the same time.

- 4. Normal/sleep mode, when key scan operations are disabled
- (1) The KS1 to KS6 pins are set to high or low level by the S0 and S1 bits in the control data.
- (2) No key scan operation is performed, whichever key is pressed.
- (3) If the key scan disabled state (KSC=1 in the control data) is set during a key scan, the key scan is stopped.
- (4) If the key scan disabled state (KSC=1 in the control data) is set when a key data read request (a low level on DO) is output to the controller, all the key data is set to 0 and the key data read request is cleared (DO is set high). Note that DO, being an open-drain output, requires a pull-up resister (between 1 to 10kΩ).
- (5) The key scan disabled state is cleared by setting KSC in the control data to 0.

Multiple Key Presses

Although the LC75806PT is capable of key scanning without inserting diodes for dual key presses, triple key presses on the K11 to K15 input pin lines, or multiple key presses on the KS1 to KS6 output pin lines, multiple presses other than these cases may result in keys that were not pressed recognized as having been pressed. Therefore, a diode must be inserted in series with each key. Applications that do not recognize multiple key presses of three or more keys should check the key data for three or more 1 bits and ignore such data.

Voltage Detection Type Reset Circuit (VDET)

This circuit generates an output signal and resets the system when power is first applied and when the voltage drops, i.e., when the power supply voltage is less than or equal to the power down detection voltage V_{DET} , which is 2.3V, typical. To assure that this function operates reliably, a capacitor must be added to the power supply line so that the power supply voltage V_{DD} rise time when the power is first applied and the power supply voltage V_{DD} fall time when the voltage drops are both at least 1ms. (See Figure 5 and Figure 6.)

System Reset

The LC75806PT supports the reset methods described below. When a system reset is applied, display is turned off, key scanning is stopped, all the key data is reset to low, and the general-purpose output ports are fixed at the low level (The S1/P1 to S8/P8 pins are forcibly set to the segment output port function and fixed at the low level. The P9/S77 pin is forcibly set to the general-purpose output port function and fixed at the low level). When the reset is cleared, display is turned on, key scanning is enabled and the general-purpose output ports state setting is enabled.

1. Reset methods

(1) Reset method by the voltage detection type reset circuit (V_{DET})

If at least 1ms is assured as the supply voltage V_{DD} rise time when power is applied, a system reset will be applied by the V_{DET} output signal when the supply voltage is brought up. If at least 1 ms is assured as the supply voltage V_{DD} fall time when power drops, a system reset will be applied in the same manner by the V_{DET} output signal when the supply voltage is lowered. Note that the reset is cleared at the point when all the serial data (1/4 duty: the display data D1 to D304 and the control data, 1/3 duty: the display data D1 to D231 and the control data) has been transferred, i.e., on the fall of the CE signal on the transfer of the last direction data, after all the direction data has been transferred. (See Figure 5 and Figure 6.)

Note: t1≥1 [ms](Power supply voltage V_{DD} rise time) t2≥1 [ms](Power supply voltage V_{DD} fall time)

[Figure 5]

• 1/3 duty

Note: t1≥1 [ms](Power supply voltage V_{DD} rise time) t2≥1 [ms](Power supply voltage V_{DD} fall time)

[Figure 6]

(2) Reset method by the \overline{RES} pin

When power is applied, a system reset is applied by setting the \overline{RES} pin low level. The reset is cleared by setting the \overline{RES} pin high level after all the serial data (1/4 duty: the display data D1 to D304 and the control data, 1/3 duty: the display data D1 to D231 and the control data) has been transferred.

In the allowable operating range ($V_{DD}=4.5$ to 6.0V), A reset is applied by setting the \overline{RES} pin low level. and the reset is cleared by setting the \overline{RES} pin high level.

2. Internal block states during the reset period

• CLOCK GENERATOR

A reset is applied and either the OSC pin oscillator is stopped or external clock reception is stopped

• COMMON DRIVER, SEGMENT DRIVER & LATCH

A reset is applied and the display is turned off. However, display data can be input to the latch circuit in this state.

• CONTRAST ADJUSTER

A reset is applied and the display contrast adjustment circuit operation is disabled.

• KEY SCAN

A reset is applied, the circuit is set to the initial state, and at the same time the key scan operation is disabled.

• KEY BUFFER

A reset is applied and all the key data is set to low.

• GENERAL PURPOSE PORT

A reset is applied, the circuit is set to the initial state.

• CCB INTERFACE, SHIFT REGISTER, CONTROL REGISTER Since serial data transfer is possible, these circuits are not reset.

3. Pin states during the reset period

Pin	State during reset
S1/P1 to S8/P8	L *6
S9 to S73	L
COM1 to COM3	L
COM4/S74	L *7
KS1/S75, KS2/S76	L *6
KS3 to KS6	L *8
P9/S77	L *9
osc	Z *10
DO	H *11

Note: *6. These output pins are forcibly set to the segment output function and held low.

- *7. This output pin is forcibly set to the common output function and held low.
- *8. These output pins are forcibly held fixed at the low level.
- *9. This output pin is forcibly set to the general-purpose output port function and held low.
- *10. This I/O pin is forcibly set to the high-impedance state.
- *11. Since this output pin is an open-drain output, a pull-up resistor of between 1 and $10k\Omega$ is required. This pin remains high during the reset period even if a key data read operation is performed.

Notes on the OSC Pin Peripheral Circuit

1. RC oscillator operationg mode (Control data bit OC=0)

When RC oscillator operationg mode is selected, an external resistor ROSC and an external capacitor COSC must be connected between the OSC pin and GND.

2. External clock operating mode (Control data bit OC=1)

When selecting the external clock operating mode, connect a current protection resistor Rg (4.7 to $47k\Omega$) between the OSC pin and the external clock output pin (external oscillator). Determine the value of the resistance according to the maximum allowable current value of the external clock output pin. Also make sure that the waveform of the external clock is not excessively distorted.

Note: Allowable current value at external clock output pin $> \frac{V_{DD}}{Rg}$

Sample Application Circuit 1

1/4 duty, 1/3 bias

Note: *12. Add a capacitor to the power supply line so that the power supply voltage V_{DD} rise time when power is applied and the power supply voltage V_{DD} fall time when power drops are both at least 1ms, as the LC75806PT is reset by the V_{DET}.

- *13. If the \overline{RES} pin is not used for system reset, it must be connected to the power supply V_{DD} .
- *14. When RC oscillator operating mode is used, the external resistor R_{OSC} and the external capacitor C_{OSC} must be connected between the OSC pin and GND, and when external clock operating mode is selected the current protection resistor Rg (4.7 to 47k Ω) must be connected between the OSC pin and the external clock output pin (external oscillator). (See the section on the OSC pin peripheral circuit.)
- *15. The DO pin, being an open-drain output, requires a pull-up resistor. Select a resistance (between 1 to $10k\Omega$) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.
- *16. The pins to be connected to the controller (CE, CL, DI, DO, \overline{RES}) can handle 3.3V or 5V.

Sample Application Circuit 2

1/3 duty, 1/3 bias

Note: *12. Add a capacitor to the power supply line so that the power supply voltage V_{DD} rise time when power is applied and the power supply voltage V_{DD} fall time when power drops are both at least 1ms, as the LC75806PT is reset by the V_{DET}.

- *13. If the RES pin is not used for system reset, it must be connected to the power supply VDD.
- *14. When RC oscillator operating mode is used, the external resistor R_{OSC} and the external capacitor C_{OSC} must be connected between the OSC pin and GND, and when external clock operating mode is selected the current protection resistor Rg (4.7 to 47kΩ) must be connected between the OSC pin and the external clock output pin (external oscillator). (See the section on the OSC pin peripheral circuit.)
- *15. The DO pin, being an open-drain output, requires a pull-up resistor. Select a resistance (between 1 to $10k\Omega$) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.
- *16. The pins to be connected to the controller (CE, CL, DI, DO, RES) can handle 3.3V or 5V.

Notes on Transferring Display Data from The Controller

When using the LC75806PT in 1/4 duty, applications transfer the display data (D1 to D304) in four operations, and in 1/3 duty, they transfer the display data (D1 to D231) in three operations. In either case, applications should transfer all of the display data within 30ms to maintain the quality of displayed image.

Notes on the Controller Key Data Read Techniques

- 1. Timer based key data acquisition
- (1) Flowchart

(2) Timing chart

t3 Key scan execution time when the key data agreed for two key scans. (615T[s])

t4 ······ Key scan execution time when the key data did not agree for two key scans and the key scan was executed again. (1230T[s])

t5 ····· Key address (43H) transfer time

Key address (4511) transfer time

t6 ····· Key data read time

$T = \frac{1}{f_{OSC}} = \frac{1}{f_{CK}}$

(3) Explanation

In this technique, the controller uses a timer to determine key on/off states and read the key data. The controller must check the DO state when CE is low every t7 period without fail. If DO is low, the controller recognizes that a key has been pressed and executes the key data read operation.

The period t7 in this technique must satisfy the following condition.

t7>t4+t5+t6

If a key data read operation is executed when DO is high (DO does not generate a key data read request output), the read key data (KD1 to KD30) and sleep acknowledge data (SA) will be invalid.

2. Interrupt based key data acquistion

(1) Flowchart

(2) Timing chart

t3 Key scan execution time when the key data agreed for two key scans. (615T[s])

t4 ······ Key scan execution time when the key data did not agree for two key scans and the key scan was executed again. (1230T[s])

t5 ····· Key address (43H) transfer time

 $T = \frac{1}{f_{OSC}} = \frac{1}{f_{CK}}$

t6 ······ Key data read time

(3) Explanation

In this technique, the controller uses interrupts to determine key on/off states and read the key data.

The controller must check the DO state when CE is low. If DO is low, the controller recognizes that a key has been pressed and executes the key data read operation. After that the next key on/off determination is performed after the time t8 has elapsed by checking the DO state when CE is low and reading the key data. The period t8 in this technique must satisfy the following condition.

t8>t4

If a key data read operation is executed when DO is high (DO does not generate a key data read request output), the read key data (KD1 to KD30) and sleep acknowledge data (SA) will be invalid.

About Data Communication Method with The Controller

1. About data communication method of 4 line type CCB format

The 4 line type CCB format is the data communication method of before. The LC75806PT must connect to the controller as followings.

- Note: *17. Connect the pull-up resistor Rup. Select a resistance (between 1 to $10k\Omega$) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.
 - *18. The (INT) pin is an input port for the key data read request signal (a low level on DO) detection.
- 2. About data communication method of 3 line type CCB format

The 3 line type CCB format is the data communication method that made a common use of the data input DI in the data output DO. The LC75806PT must connect to the controller as followings.

- Note: *17. Connect the pull-up resistor Rup. Select a resistance (between 1 to $10k\Omega$) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.
 - *18. The (INT) pin is an input port for the key data read request signal (a low level on DO) detection.

In this case, Applications must transfer the data communication start command before the serial data input (CCB address "42H", display data and control data transfer) or serial data output (CCB address "43H" transfer, key data read) to avoid the collision of the data input signal DI and the data output signal DO.

Then applications must transfer the data communication stop command when the controller wants to detect the key data read request signal (a low level on DO) during a movement stop of the serial data input and the serial data output.

- (1) When CL is stopped at the low level
- (2) When CL is stopped at the high level

- <2> Data communication stop command
 - (1) When CL is stopped at the low level

(2) When CL is stopped at the high level

Data Communication Flowchart of 4 Line Type or 3 Line Type CCB Format

1. Flowchart of the initial setting when power is turned on.

Note: The flowchart of initial setting when power is turned on is same regardless of the 4 line type or 3 line type CCB format.

Take explanation about "system reset" into account.

2. Flowchart of the serial data input

Note: *19. In the case of the 4 line type CCB format, the transfers of data communication start command and data communication stop command are unnecessary, and, in the case of the 3 line type CCB format, these transfers are necessary.

3. Flowchart of the serial data output

Note: *20. In the case of the 4 line type CCB format, the transfer of data communication start command is unnecessary, and, in the case of the 3 line type CCB format, the transfer is necessary.

*21. Because the serial data output has the role of the data communication stop command, it is not necessary to transfer the data communication stop command some other time.

Timing Chart of 4 Line Type and 3 Line Type CCB Format

1. Timing chart of 4 line type CCB format

<Example 2>

<Example 3>

Note: *22. When the key data agrees for two key scans, the key scan execution time is 615T[s].

And, when the key data does not agree for two key scans and the key scan is executed again, the key scan execution time is 1230T[s].

$$T = \frac{1}{fOSC} = \frac{1}{fCK}$$

2. Timing chart of 3 line type CCB format

<Example 1> Key on Key off Key input Key scan Key scan execution Key scan execution *22 CE CCB address CCB address CCB address CCB address CCB address (42H) (42H) (42H) (43H)(42H) DI/DO Serial data Data Data communication Data communication Serial data input communication output start command (Display and control stop command start command (Key data data transfer) read) Key data read Key data read

request

Note: *22. When the key data agrees for two key scans, the key scan execution time is 615T[s].

And, when the key data does not agree for two key scans and the key scan is executed again, the key scan execution time is 1230T[s].

$$T = \frac{1}{fOSC} = \frac{1}{fCK}$$
